Introduction

The World at the beginning of the 21st Century would be a place of unimaginable change to our forefathers. Since 1900 the human population has undergone a fourfold growth coupled with an unparalleled development in the technology at our disposal. The last vestiges of the unknown World are gone, and previously hostile realms claimed for habitation. The advent of aviation technology and the growth of mass tourism have allowed people to travel further and more frequently than ever before

Allied to this, the rapid growth of global communication systems mean that World events have become more accessible than ever before and their knock on effects quickly ripple across the whole planet. News broadcasts bring the far-flung corners of the world into everyone's lives, and with it, a view of the people and places that make up that region. The mysteries of the World that once fueled global exploration and the quest to discover the unknown are behind us; we inhabit a world of mass transportation, a world where even the most extreme regions have been mapped, a world with multi faceted view points on every event, a World of communication overload.

However, does this help us make sense of the World? It is increasingly important for us to have a clear vision of the World in which we live and such a deluge of information can leave us struggling to find some context and meaning. It has never been more important to own an atlas; the *DK Complete Atlas of the World* has been conceived to meet this need. At its core, like all atlases, it seeks to define where places are, to describe their main characteristics, and to locate them in relation to other places. By gathering a spectacular collection of satellite imagery and draping it with carefully selected and up-to-date geographic information this atlas filters the World's data into clear, meaningful and user-friendly maps.

The World works on different levels and so does the *DK Complete Atlas of the World*. Readers can learn about global issues of many kinds or they can probe in a little further for the continental context. Delving even further they can explore at regional, national or even subnational level. The very best available satellite data has been used to create topography and bathymetry that reveal the breathtaking texture of landscapes and sea-floors. These bring out the context of the places and features selected to appear on top of them.

This second edition of the *DK Complete Atlas of the World* incorporates hundreds of revisions and updates affecting every map and every page, distilling the burgeoning mass of information available through modern technology into an extraordinarily detailed and reliable view of our World.

Contents

The atlas is organized by continent, moving eastward from the International Date Line. The opening section describes the world's structure, systems and its main features. The Atlas of the World which follows, is a continent-by-continent guide to today's world, starting with a comprehensive insight into the physical, political, and economic structure of each continent, followed by detailed maps of carefully selected geopolitical regions.

The Solar System

The Solar System consists of our local star, the Sun, and numerous objects that orbit the Sun – eight planets, five currently recognized dwarf planets, over 165 moons orbiting these planets and dwarf planets, and countless smaller bodies such as comets and asteroids. Including a vast outer region that is populated only by comets, the Solar System is about 9,300 billion miles (15,000 billion km) across. The much smaller region containing just the Sun and planets is about 7.5 billion miles (12 billion km) across. The Sun, which contributes over 99 percent of the mass of the entire Solar System, creates energy from nuclear reactions deep within its interior, providing the heat and light that make life on Earth possible.

What is a Planet?

The International Astronomical Union defines a Solar System planet as a near-spherical object that orbits the Sun (and no other body) and has cleared the neighborhood around its orbit of other bodies. A dwarf planet is a planet that is not big enough to have cleared its orbital neighborhood. Extra-solar planets are objects orbiting stars other than the Sun.

The Sun

The Sun is a huge sphere of exceedingly hot plasma (ionized gas), consisting mainly of the elements hydrogen and helium. It formed about 4.6 billion years ago, when a swirling cloud of gas and dust began to contract under the influence of gravity. When the center of this cloud reached a critically high temperature, hydrogen nuclei started combining to form helium nuclei – \boldsymbol{a} process called nuclear fusion – with the release of massive amounts of energy. This process continues to this day.

SOLAR ECLIPSE

A solar eclipse occurs when the Moon passes between Earth and the Sun, casting its shadow on Earth's surface. During a total eclipse (below), viewers along a strip of Earth's surface, called the area of totality, see the Sun totally blotted out for a short time, as the umbra (Moon's full shadow) sweeps over them. Outside this area is a larger one, where the Sun appears only partly obscured, as the penumbra (partial shadow) passes over

THE MOON'S PHASES

As the Moon orbits Earth, the relative positions of Moon, Sun and Earth continuously change. Thus, the angle at which the Moon's sunlit face is seen by an observer on Earth varies in a cyclical fashion, producing the Moon's phases, as shown at right. Each cycle takes 29.5 days.

1. WAXING CRESCENT

2. FIRST QUARTER

The Moon

Earth's only satellite, the Moon, is thought to have formed 4.5 billion years ago from a cloud of debris produced when a large asteroid hit the young Earth. The Moon is too small to have retained an atmosphere, and is therefore a lifeless, dusty and dead world. However, although the Moon has only about 1 percent of the mass of the Earth, its gravity exerts an important influence on Earth's oceans, manifest in the ebb and flow of the tides.

INSIDE THE SUN The Sun has three internal layers. At its center is the core, where temperatures reach 27 million°F (15 million°C) and nuclear fusion occurs. The radiative zone is a slightly cooler region through which energy radiates away from the core. Further out, in the convective zone, plumes of hot plasma carry the energy towards the Sun's visible surface layer, called the photosphere. Once there, the energy escapes as light, heat and other forms of radiation.

DWARF PLANETS In 2006 a new type of dwarf planet was defined in an attempt to classify the numerous smaller bodies within the solar system that behave like planets physically but which are only a fraction of the size of the major planets. Currently, there are five dwarf planets recognized under this new system, Ceres, Pluto, Haumea, Makemake, and Eris. (dwarf planet) PLUTO (dwarf planet) NEPTUNE URANUS THE OUTER PLANETS THE OUTER PLANETS **Orbits** The four gigantic outer planets – Jupiter, Saturn, All the Solar System's planets and dwarf planets Uranus and Neptune – consist mainly of gas, liquid orbit the Sun in the same direction and (apart and ice. All have rings and many moons. The dwarf from Pluto) roughly in the same plane. All the planet Pluto is made of rock and ice. orbits have the shapes of ellipses (stretched circles). However in most cases, these ellipses are close to being circular: only Pluto and Eris have THE INNER PLANETS very elliptical orbits. Orbital period (the time it The four planets closest to the Sun takes an object to orbit the Sun) increases with Mercury, Venus, Earth and Mars - are distance from the Sun. The more remote objects composed mainly of rock and metal. They not only have further to travel with each orbit, are much smaller than the outer planets,

AVERAGE DISTANCE FROM THE SUN

they also move more slowly.

THE INNER PLANETS

have few or no moons, and no rings.

Shaping the Landscape

The basic material of Earth's surface is solid rock: valleys, deserts, soil, and sand are all evidence of the powerful agents of weathering, erosion and deposition that constantly transform Earth's landscapes. Water, whether flowing in rivers or grinding the ground in the form of glaciers, has the most clearly visible impact on Earth's surface. Also, wind can transport fragments of rock over huge distances and strip away protective layers of vegetation, exposing rock surfaces to the impact of extreme heat and cold. Many of the land-shaping effects of ice and water can be seen in northern regions such as Alaska (below), while the effects of heat and wind are clearly visible in the Sahara (far right).

glacier and later flooded by the sea is called a fiord.

Ice and water

Some of the most obvious and striking features of Earth's surface are large flows and bodies of liquid water, such as rivers, lakes, and seas. In addition to these are landforms caused by the erosional or depositional power of flowing water, which include gullies, river valleys, and coastal features such as headlands and deltas. Ice also has had a major impact on Earth's appearance. Glaciers—rivers of ice formed by the compaction of snow—pick up and carry huge amounts of rocks and boulders as they pass over the landscape, eroding it as they do so. Glaciallysculpted landforms range from mountain cirques and U-shaped valleys to fiords and glacial lakes.

TIDEWATER GLACIER

LANDSLIDE

a mountain by glacial action. It may be ice-filled.

POSTGLACIAL FEATURES of ancient glacial action. Other signs in forms of sculpted ridge and hummock.

Over thousands of years, rivers erode form characteristic V-shaped valleys, varrow floors and steeply-rising sides.

Gullies are deep channels cut by rapidly flowing water, as here beli Alaska's Mount Denali.

Heat and wind

Marked changes in temperature—rapid heating caused by fierce solar radiation during the day, followed by a sharp drop in temperature at night—cause rocks at the surface of hot deserts to continually expand and contract. This can eventually result in cracking and fissuring of the rocks, creating thermally-fractured desert landscapes. The world's deserts are also swept and scoured by strong winds. The finer particles of sand are shaped into surface ripples, dunes, or sand mountains, which can rise to a height of 650 ft (200 m). In other areas, the winds sweep away all the sand, leaving flat, gravelly areas called desert pavements.

DESERT LANDSCAPES

In desert areas, wind picks up loose sand and blasts it at the surface, creating a range of sculpted landforms from faceted rocks to large-scale features such as yardangs. Individually sculptedrocks are called ventifacts. Where the sand abrasion is concentrated near the ground, it can turn these rocks into eccentrically-shaped "stone mushrooms." Other desert features are produced by thermal cracking and by winds continually redistributing the vast sand deposits.

FEATURES OF A DESERT SURFACE

DUST STORM

A common phenomenon in some deserts, dust storms result from intense heating of the ground creating strong convection currents.

LOESS DEPOSIT

A deposit of silt that has been transported over long distances by wind, then compacted. Loess is found in a few marginal areas of the Sahara.

YARDANG

A yardang is a ridge of rock produced by wind erosion, usually in a desert. Large yardangs can be many miles long.

DESERT PAVEMENT

from wind removing all the sand from an area of desert.

Part of the Grand Erg Oriental, this

The Tefedest is an impressive, sun-baked, wind-eroded, granite massif located in southern Algeria

This highland region, called the Ahaggar Mountains, has largely been blasted free of sand and is heavily eroded throughout

TRANSVERSE DUNES

This series of parallel sand ridges lies at right angles to the prevailing wind direction.

VENTIFACT A ventifact is a rock that has beer

heavily sculpted and abraded by wind-driven sand.

CRACKED DESERT

WADI

desert regions, that carry water only during occasional periods of heavy rain.

BARCHAN DUNE

This arc-shaped type of dune migrates across the desert surface, blown by the wind.

changes cause the water to become denser and sink, forcing horizontal movements of deeper water.

Global Climate

The climates of different regions on Earth are the typical long-term patterns of temperature and humidity in those regions. By contrast, weather consists of short-term variations in factors such as wind, rainfall, and sunshine. Climates are determined primarily by the Sun's variable heating of different parts of Earth's atmosphere and oceans, and by Earth's rotation. These factors drive the ocean currents and prevailing winds, which in turn redistribute heat energy and moisture between the equator and poles, and between sea and land. Most scientists think that major changes are currently occurring in global climate due to the effects of rising carbon dioxide levels in the atmosphere.

The atmosphere

Earth's atmosphere is a giant ocean of air that surrounds the planet. It extends to a height of about 625 miles (1000 km) but has no distinct upper boundary. The Sun's rays pass through the atmosphere and warm Earth's surface, causing the air to move and water to evaporate from the oceans.

Cool air subsides at North Pole Polar easterly blowing away from high pressure over North Pole Ferrell cell Hadley cell Air rises in subpolar region Ferrell cell Air rises near equator Air rises near equator Subtropical jet stream Roaring Forties Southeasterly trade wind in Ferrell cell Northeasterly trade wind in Hadley cell Northeasterly trade wind caused by Coriolis deflection of surface air flow in Ferrell cell

Winds, currents, and climate

Earth has 12 climatic zones, ranging from ice-cap and tundra to temperate, arid (desert), and tropical zones.

Each of these zones features a particular combination of temperature and humidity. The effects of prevailing winds, ocean currents of both the warm and cold variety, as well as latitude and altitude, all have an important influence on a region's climate.

For example, the climate of western

Europe is influenced by the effects of the warm North Atlantic

Drift current.

RADES

THERMOSPHERE

This layer extends from a height of 50 miles (80 km) upward. Its temperature increases rapidly above a height of 60 miles (90 km), due to absorption of highly energetic solar radiation.

MESOSPHERE

The temperature of the lower part of this layer stays constant with height; but above 35 miles (55 km), it drops, reaching -112°F (80°C) at the mesopause.

STRATOSPHERE

The temperature of the stratosphere is a fairly constant -76° F (-60°C) up to an altitude of about 12 miles (20 km), then increases, due to absorption of ultraviolet radiation.

TROPOSPHERE

This layer extends from Earth's surface to a height of about 10 miles (16 km) at the equator and 5 miles (8 km) at the poles. Air temperature in this layer decreases with height.

WESTERLIES

West Wind Drift

Antarctic Circle

Air moves within giant atmospheric cells called Hadley, Ferrell, and polar cells. These cells are caused by air being warmed and rising in some latitudes, such as near the equator, and sinking in other latitudes. This north-south circulation combined with the Coriolis effect (below) produces the prevailing surface winds.

Air moving over Earth's surface is deflected in a clockwise direction in the northern hemisphere and counterclockwise in the south. Known as the Coriolis effect, and caused by Earth's spin, these deflections to the air movements produce winds such as the trade winds and westerlies. Deflected clockwise

Deflected counterclos

Initial

Temperature and precipitation

The world divides by latitude into three major temperature zones: the warm tropics, the cold polar regions; and an intermediate temperate zone. In addition, temperature is strongly influenced by height above sea level. Precipitation patterns are related to factors such as solar heating, atmospheric pressure,

winds, and topography. Most equatorial areas have high rainfall, caused by moist air being warmed and rising, then cooling to form rain clouds. In areas of the subtropics and near the poles, sinking air causes high pressure and low precipitation. In temperate regions rainfall is quite variable.

Life on Earth

A unique combination of an oxygen-rich atmosphere and plentiful surface water is the key to life on Earth, where few areas have not been colonized by animals, plants, or smaller life-forms. An important determinant of the quantity of life in a region is its level of primary production—the amount of energyrich substances made by organisms living there, mainly through the process of photosynthesis. On land, plants are the main organisms responsible for primary production; in water, algae fulfil this role. These primary producers supply food for animals. Primary production is affected by climatic, seasonal, and other local factors. On land, cold and aridity restrict the quantity of life in a region, whereas warmth and regular rainfall allow a greater diversity of species. In the oceans, production is mainly affected by sunlight levels, which reduce rapidly with depth, and by nutrient availability.

just a few species, such as pola bears in the Arctic.

Biogeographical regions

Earth's biogeographical regions, or biomes, are communities where certain species of plants and animals coexist within the constraints of particular climatic conditions. They range from tundra to various types of grassland, forest, desert, and marine biomes such as coral reefs. Factors like soil richness, altitude, and human activities such as deforestation can affect the local distribution of living species in each biome.

known as steppe or prairie, grassland of occurs mainly in the northern hemisphe uth America (the Pampas).

This type of grassland is widespread in Africa and South America, supporting large numbers of grazing animals and their predators.

Animal diversity

The number of animal species, and the range of genetic diversity within the populations of those species, determines the level of animal diversity within each country or other region of the world. The animals that are endemic to a region—that is, those found nowhere else on the planetare also important in determining its level of animal diversity.

Number of plant species per country

more than 50 7000–49,999 3000–6999 2000–2999 1000–1999 600–999 0–599

data not available

With little soil and large areas of frozen ground, the tundra is largely treeless, though briefly clothed by small flowering plants in summer.

TEMPERATE RAIN FOREST

Occurring in mid-latitudes in areas of high rainfall, these forests may be predominantly coniferous or mixed with deciduous species.

Occurring in clear tropical waters, coral reefs support an extraordinary diversity of species, especially fish and many types of invertebrate.

Plant diversity

Environmental conditions, particularly climate, soil type, and the extent of competition with other living organisms, influence the development of plants into distinctive forms and thus also the extent of plant diversity. Human settlement and intervention has considerably reduced the diversity of plant species in many areas.

Man and the Environment

The impact of human activity on the environment has widened from being a matter of local concern (typically over the build-up of urban waste, industrial pollution, and smog) to affect whole ecosystems and, in recent decades, the global climate. Problems crossing national boundaries first became a major issue over acid rain, toxic waste dumping at sea, and chemical spillages polluting major rivers. Current concerns center on loss of biodiversity and vital habitat including wetlands and coral reefs, the felling and clearance of great tropical and temperate forests, overexploitation of scarce resources, the uncontrolled growth of cities and, above all, climate change.

Climate change

Global warming is happening much faster than Earth's normal long-term cycles of climate change. The consequences include unpredictable extreme weather and potential disruption of ocean currents. Melting ice-caps and glaciers, and warmer oceans, will raise average sea levels and threaten coastlines and cities. Food crops like wheat are highly vulnerable to changes in temperature and rainfall. Such changes can also have a dramatic affect on wildlife habitats.

Since 1800 the amount of $\rm CO_2$ in the atmosphere has risen sharply. Urgent worldwide action to control emissions is vital to stabilize the level by the mid 21st century.

THE GREENHOUSE EFFECT

Some solar energy, reflected from the Earth's surface as infra red radiation, is reflected back as heat by "greenhouse gases" (mainly carbon dioxide and methane) in the atmosphere. Nearly all scientists now agree that an upsurge in emissions caused by humans burning fossil fuel has contributed to making the resultant warming effect a major problem.

OZONE HOLE

Man-made chlorofluorocarbons (CFCs), used in refrigeration and aerosols, damaged the ozone layer in the stratosphere which helps filter out the sun's harmful ultraviolet rays. When a seasonal ozone hole first appeared in 1985 over Antarctica, a shocked world agreed to phase out CFC use.

FOOD AND LAND USE

The world has about five billion hectares of agriculturally useful land, well under one hectare per person. The majority of this is pasture for grazing. Crops are grown on about 30 percent (and nearly a fifth of cropland is artificially irrigated). Mechanized farming encouraged vast single crop "monocultures," dependent on fertilizers and pesticides. North America's endless prairies of wheat and corn, huge soybean plantations, and southern cotton fields are mirrored in Ukraine (wheat), Brazil and Argentina (soya) and Uzbekistan (cotton). Elsewhere, scarce farmland can be squeezed by the housing needs of growing urban populations. Current interest in crop-derived "biofuels" means further pressure to grow food more productively on less land.

Intensive farming. Satellite photography picks up the greenhouses that now cover almost all the land in this Spanish coastal area southwest of Almeria.

DEFORESTATION

At current rates of destruction, all tropical forests, and most old-growth temperate forest, will be gone by 2090. The Amazon rain forest is a valuable genetic resource, containing innumerable unique plants and animals, as well as acting as a crucial natural "sink" for absorbing climate-damaging carbon dioxide. Stemming the loss of these precious assets to logging and farming is one of the major environmental challenges of modern times.

Over 25,000 sq miles (60,000 sq km) of virgin rain forest are cleared annually by logging and agricultural activities, destroying an irreplaceable natural resource.

GLACIATION

The world's glaciers and ice sheets have been in retreat for decades, forming less new ice at high altitudes than they lose by melting lower down. The loss of ice from Greenland doubled between 1996 and 2005, with alarming implications for rising sea levels. Other dramatic evidence of global warming includes the rapid thinning of ice in the Himalayas, and the highly symbolic loss of the snowcap on Africa's Mount Kilimanjaro.

Helheim Glacier 2005 By 2005 (right) it had retreated by 2.5 miles (4 km).

Delhi 1971

In 1971 Delhi *(above)* occupied an area of about 190 sq miles (500 sq km).

Delhi 1999

by 1999 (right) it had sprawled to cover 500 sq miles (1300 sq km). It vies with Mumbai in the southwest to be the sub-continent's most populous city, fast approaching 20 million people.

CITY GROWTH

The world in 2006 had five cities with populations over 20 million—Tokyo, Mexico City, Seoul, New York City, and São Paulo. The number of cities with populations between 10 and 20 million has reached 20 and continues to rise. The search for work, and the hope of escape from rural poverty, drives migration from rural to urban areas across the developing world. Urban dwellers now amount to more than half the world's population, and consume more resources than their rural counterparts.

Population and Settlement

Earth's human population is projected to rise from its current level of 6.9 billion to between 7.6 and 11 billion by the year 2050. The distribution of this population is very uneven and is dictated by climate, terrain, and by natural and economic resources. Most people live in coastal zones and along the valleys of great rivers such as the Ganges, Indus, Nile, and Yangtze. Deserts cover over 20 percent of Earth's surface but support less than 5 percent of its human population. Over half the world's population live in cities—most of them in Asia, Europe, and North America—as a result of mass migrations that Population density by country (population per sq mile) have occurred from rural areas as people search for jobs. Many of these people live in so-called "megacities"—sprawling urban areas that have populations higher than 10 million. Population density A few regions, including Europe, India, and much of eastern Asia, have extremely high population densities. Within these areas, a few spots, such as Monaco and Hong Kong, have densities of over 12,900 per sq mile (5000 people per sq km). Other regions (mostly desert, mountain, ice cap, tundra, or thickly forested areas) have densities close to zero -examples include large areas of NORTH AMERICA Australia, western China, Siberia, North Africa, Canada, Greenland, and much of the Amazon rain forest region. Million-person cities In the year 1900 there were fewer than 20 cities in the world with a population that exceeded one million. By 1950 there were 75 such cities, and by the year 2000 there were more than 300 such cities, 40 of them in China alone, with another 30 in India, 14 in Brazil, and 10 in Japan. Population density sons per sq mile Million-cities in 1900 SOUTH AMERICA World population World land area 5.5% 11.8% Million-cities in 1950 ANTARCTICA ld population World land area 0.0% 8.9% Million-cities in 2006 **GREATER TOKYO** The Greater Tokyo Area is the most populous urban area in the world. with an estimated head count in 2011 of 35.6 million. and also the boundaries of Tokyo City in 1860 (red) and 1964 (yellow).

Language

Over 6800 different languages exist throughout the world, each one with its own unique evolutionary history and cultural connotations. Most of these languages are spoken only by small groups of people in remote regions. Sadly these minority tongues are dying out—it is estimated that about a third will have disappeared by the year 2100. The relatively small number of widely-spoken languages have gained their current predominance and pattern of distribution through a variety of historical factors. Among these have been the economic, military, or technological success of certain peoples and cultures, differing population growth rates, and the effects of migrations and colonization.

The European Union (EU) embraces the diversity of its 27 countries and 23 official languages by providing a translation and interpretation service for the majority of its meetings and documentation. This costs around US\$ 650 million per year, which equates to 1 percent of the EU budget.

The colonial powers

Colonialism between the 15th and 20th centuries had a major influence in establishing the world prevalence of various, mainly European, languages. Britain, for example, was the colonial power in Canada, the USA (until 1776), the Indian subcontinent, Australia, and parts of Africa and the Caribbean. Hence, English is still the main (or a major) language in these areas. The same applies to France and the French language in parts of Africa and southeast Asia, and to Spain and the Spanish language in much of Latin America. For similar reasons, Portuguese is the main language in Brazil and parts of Africa, and there are many Dutch speakers in Indonesia.

This dual language sign, written in both in Hindi and English, stands outside Shimla railway station in northern India. The sign reflects India's past—the British used Shimla as their summer capital during the colonial period.

TOP TEN LANGUAGES

About 45 percent of people speak one of just ten languages as their native tongue. Mandarin Chinese is spoken by far the largest number—a situation likely to persist, as minority language speakers in China are encouraged to switch to Mandarin. English usage is also increasing, as it is the most favored language on the internet and in business circles. Wherever English is not the mother tongue, it is often the second language.

On most health parameters, the countries of the world split into two distinct groups. The first of these encompass the richer, developed, countries, where medical care is good to excellent, infant mortality and the incidence of deadly infectious diseases is low, and life expectancy is high and rising. Some of the biggest health problems in these countries arise from overeating, while the two main causes of death are heart disease and cancer. The second region consists of the poorer developing countries, where medical care is much less adequate, infant mortality is high, many people are undernourished, and infectious diseases such as malaria are major killers. Life expectancy in these

Life expectancy

Life expectancy has risen remarkably in developed countries over the past 50 years and has now topped 80 years in many of them. In contrast, life expectancy in many of the countries of sub-Saharan Africa has fallen well below 50, in large part due to the high prevalence of HIV/AIDS.

Many people in developed countries are now living for 15–20 years after retirement, putting greater pressure on welfare and health services.

1000 population. Some communist and former communist countries such as Cuba and Russia score well in this regard. In general, healthcare provision is good or adequate in most of the world's richer

countries but scanty throughout

much of Africa and in parts of Asia and Latin America.

Swaziland: currently has the lowest life expectancy in the orld, at about 40 years, due to widespread HIV/AIDS.

Cigarette smoking—one of the most harmful activities to health—is common throughout much of the world. Smoking prevalence is generally highest in the richer, developed countries. However, awareness of the health risks has seen cigarette consumption in most of these countries stabilize or begin to fall. By contrast, more and more people, especially males, are taking up the habit in poorer developing countries.

Preventive medicine

Throughout the world, doctors recognize that the prevention of disease and disease transmission is just as important as the treatment of illness. Preventive medicine has many aspects and includes advice about diet and nutrition; education about the avoidance of health-threatening behaviors such as smoking, excess alcohol consumption, and unprotected sex; and the use of vaccines against diseases such as typhoid, polio and cholera. In developing countries, some of the main priorities in preventive medicine are the provision of pure water supplies and proper sanitation, as well as measures against malaria, including the use of antimalarial drugs and mosquito nets.

The use of mosquito nets greatly reduces the transmission of malaria and the risk of infection

Communicable diseases

Despite advances in their treatment and prevention, infectious diseases remain a huge problem, especially in developing countries. Three of the most common and deadly are tuberculosis (TB), HIV/AIDS, and malaria. Of these, active TB affects about 25 million people (often as a complication of AIDS), with a particularly high prevalence in parts of Africa. HIV/AIDS has spread since 1981 to become a global pandemic. Malaria affects about 225 million people every year.

TOP TEN KILLER DISEASES, 2004

The world's biggest killer diseases fall into two main groups. One group, which includes HIV/AIDS, malaria, tuberculosis, and childhood diseases such as measles, mainly kills people in poor countries. The other group includes cardiovascular diseases and cancer, the big killers in rich countries.

Water Resources

Water covers 71 percent of Earth's surface, but only 2.5 percent of this is fresh water, and two thirds of that is locked up in glaciers and polar ice sheets. Patterns of human settlement have developed around fresh water availability, but increasing numbers of people are now vulnerable to chronic shortage or interruptions in supply. Worldwide, fresh water consumption multiplied more than sixfold during the 20th century as populations increased and agriculture became more dependent on irrigation, much of it hugely wasteful because of evaporation and run-off. Industrial water demand also rose, as did use in the home, for washing, flushing, cooking, and gardening.

Amid the desert of Wadi Rum, Jordan, crops grow on circular patches of land irrigated with water from an underground aquifer

Water withdrawal

Agriculture accounts for 70 percent of water consumption worldwide. Industry and domestic use each account for 15 percent. Excessive withdrawal of water affects the health of rivers and the needs of people. China's Yellow River now fails to reach the sea for most of the year.

Drought

The disruption of normal rainfall patterns can cause drought problems even in temperate zones, with consequences ranging from domestic water usage restrictions to low crop yields to forest fires. In regions of the developing world where monsoon rains fail, or water is perennially scarce, drought is a life or death issue. Parts of central and east Africa, for instance, have suffered severe and recurring droughts in recent decades, with disastrous results including destruction of livestock, desertification, famine, and mass migration.

S O U T H E R N O C E A N

In a severe drought, river beds may dry up (above left), leaving stranded fish to die, as here in Florida

A Chinese farmer waters dry fields (above) in China's southern province of Guangdong. This picture was taken in May 2002, but the image is timeless; it could be August 2006 in Sichuan province, to the northwest of here—or almost any year in water-stressed northern China

Water stress

A region is under "water stress" when the rate of water withdrawal from its rivers and aquifers exceeds their natural replenishment, so that people living there are subject to frequent shortages. Currently 1.7 billion people live in "highly stressed" river basins worldwide. This is a major potential cause of conflict, particularly when several countries share one river; the Euphrates, running through Turkey, Syria, and Iraq, or the rivers of southern China running south into Korea, are just two examples.

WATER AVAILABILITY (by percentage of world's population)

Clean drinking water

Sub-Saharan Africa is among the most deprived regions for lack of access to safe drinking water. Worldwide, this terrible health hazard affects over a billion people—at least 15 percent of the population. One of the agreed United Nations "millennium goals" for international development is to halve this proportion by 2015, by tackling chemical pollution from agriculture and industry, and by introducing essential purification facilities and local supply systems. In the industrialized $% \left\{ \left(1\right) \right\} =\left\{ \left($ world, people have come to expect clean drinking water on tap, even if they face rising prices for its treatment and supply.

Mozambican children (above) fetch precious water in metal pans

Many wells and village ponds ran dry in the severe drought of 2003, leaving local people to wait for irregular supplies brought in by state-run tablers. state-run tankers.

Access to safe drinking water source

Economic Systems

The world economy is now effectively a single global system based on "free market" capitalist principles. Few countries still cling, like North Korea, to the "command economy" formula developed in the former communist bloc, where centralized state plans set targets for investment and production. In the West, state ownership of companies has greatly diminished thanks to the wave of privatization in the last 25 years. Major companies move capital and raw materials around the globe to take advantage of different labor costs and skills. The World Trade Organization (WTO) promotes free trade, but many countries still use subsidies, and protect their markets with import tariffs or quotas, to favor their own producers.

Enormous volumes of trade pass through the world's stock markets making them key indicators of the strength of the

Balance of trade

Few countries earn from their exports exactly as much as they spend on imports. If the imbalance is persistently negative, it creates a potentially serious problem of indebtedness. The European Union's (EU) external trade is broadly in balance, but the US balance of trade has been in deficit since the 1970s, partly because it imports so many consumer goods. This deficit now stands at around US\$ 500 billion a year.

Energy

Countries with oil and gas to sell (notably in the Middle East and Russia) can charge high prices; trade in fuel was worth US\$ 1.4 trillion in 2005. The US and others are turning back to nuclear power (despite safety fears) for generating electricity. China relies heavily on (polluting) coal. Renewable technologies promise much, but so far make relatively minor contributions.

the trip took just 21 hours by air.

London–Sydney by air including one refueling stop

1850

Mass travel is now a ubiquitous feature of all developed countries, and the provision of transport and tourism facilities one of the world's biggest industries, employing well over 100 million people. The travel explosion has come about, first, through major improvements in transportation technology; and second, as a result of increasing amounts of disposable income and leisure time in the world's wealthier countries. The main reasons for travel today include leisure pursuits and tourism (accounting for well over half of the total financial outlay), work and business, pilgrimage, migration, and visits to family and friends.

around 4.2 billion air travelers a year passing through over 1600 international and domestic airports. This figure is forecast to grow by 4 percent each year, leading to increased pressure on air traffic control and ground handling systems that, in many areas, are already close to maximum capacity.

Mobile phone users per 1000 people

Media and Communications

Over the past 50 years, the term "media" has come to denote various means of communicating information between people at a distance. These include mass media—methods such as newspapers, radio, and television that can be used to rapidly disseminate information to large numbers of people—and two-way systems, such as telephones and e-mail. Currently, the communication systems undergoing the most rapid growth worldwide include mobile telephony and various Internet-based applications, such as web sites, blogs, and podcasting, which can be considered forms of mass media.

Internet usage

Internet usage has grown extremely rapidly since the early 1990s, largely as a result of the invention of the World Wide Web. Usage rates are highest in the USA (where about 80 percent of people were using the Internet in 2006), Australia, Japan, South Korea, and Finland. They are lowest in Africa, where on average less than 5 percent of the population were Internet users in 2006.

The internet emerged in the early 1990s as a computer-based global unication system Since then massive growth has seen user numbers increase to around 1.1 billion people or roughly 17 percent of

By 2006, there were more than 2.5 billion mobile phone users worldwide. In some parts of Europe, such as Italy, almost everyone owns and uses a mobile—many possess more than one phone. In contrast, throughout

Mobile phone usage

much of Southern Asia and Africa, less than 10 percent of the population are users. As well as utilizing them as telephones, most users now employ the devices for the additional functions they offer, such as text

Satellite Communications

Modern communications satellites are used extensively for international telephony, for television and radio broadcasting, and to some extent for transmitting Internet data. Many of these satellites are deployed in clusters or arrays, often in geostationary orbits—that is, in positions that appear fixed to Earth-based observers.

Geostationary Orbit (GEO) Altitude: 3100–12,500 miles (5000–20,000 km) Digital TV, mobile and net

Highly Elliptical Orbit (HEO) Altitude: 25,000 miles (40,000 km) Orbit: 5–6 hours

The Political World

Borders, conflicts and disputes

Conflict evolved in the 20th century from conventional land- or sea-based warfare to increasingly long-range airborne attacks. Nuclear arms from 1945 took this to the intercontinental scale. The Cold War presented a new type of conflict, underlined by the race for weapons capabilities between the US and the Soviet Union. In Korea, Vietnam, the Middle East and elsewhere, soldiers and civilians

were exposed to deadly chemicals. International treaties aimed to prevent the spread of nuclear, biological and chemical "weapons of mass destruction". Intercommunal conflict and "ethnic cleansing" reminded the world that horror needed no sophisticated weaponry. After 9/11, the US-led "war on terror" perceived conflict in a new light, where international terrorism knew

THE PEACEKEEPERS

no borders.

Over 130 countries have contributed around a million troops to UN missions to monitor peace processes and help implement peace accords since 1948. Regional alliances such as NATO and the African Union (AU) are increasingly deploying their own multinational forces in trouble-spots, while Australia has intervened in a similar manner in nearby Pacific island states. Peacekeepers oversaw East Timor's elections in 2001 and subsequent celebration of independence (above). The US defines many of its activities as peacekeeping, despite the confrontational nature of some of its interventions

African ethnic minorities in Darfur in western Sudan have suffered appalling violence since 2003 at the hands of genocidal Arab Janjaweed militias, for which the government in Khartoum denies responsibility. Displaced in their hundreds of thousands, refugees receive inadequate protection and aid from an international community unwilling to commit to full-scale intervention.

GULF CONFLICTS

Although the West armed Saddam Hussein in the brutal 1980s Iran-Iraq War, his unprovoked invasion of Kuwait in 1990 was decried the world over. A US-led coalition, including Arab states, repelled his troops but left him in power. A decade of sanctions followed until, in 2003, Saddam was finally toppled by US-led forces. Following elections in 2005, Iraq has struggled to contain a violent insurgency.

Lines on the map

The determination of international boundaries can use a variety of criteria. Many borders between older states follow physical boundaries, often utilizing natural defensive features. Others have been determined by international agreement or arbitration, or simply ended up where the opposing forces stood at the end of a conflict.

WORLD BOUNDARIES

Dates from which current boundaries have existed

POST-COLONIAL BORDERS

Independent African countries have largely inherited the earlier carve up of the continent by European colonial powers. These often arbitrarily divided or grouped differing ethnic and religious groups

which has, in turn, contributed to the tensions that underlie the many civil conflicts that have plagued post-colonial Africa.

ENCLAVES

Changes to international boundaries occasionally create pockets of land cut off from the main territory of the country they belong to. In Europe, Kaliningrad has been separated from the rest of the Russian

Federation since the independence of the Baltic States. Likewise, when Morocco was granted independence, Spain retained the coastal enclaves of Ceuta and Melilla.

GEOMETRIC BORDERS

Straight lines and lines of longitude and latitude have occasionally been used to determine international boundaries: the 49th Parallel forms a large section of the Canada-US border, while the 38th Parallel roughly

divides the Korean Peninsula. Internal administrative divisions within Canada, the US, and Australia also use geometric boundaries.

PHYSICAL BORDERS

Rivers account for one-sixth of the world's borders: the Danube forms part of the boundaries for nine European nations. Changes in a river's course or disruption of its flow can lead to territorial disputes. Lakes and mountains also form natural borders.

Lake border (right) Mountain border (below left) River border (below right)

The World's Time Zones

TIME ZONES

Because Earth is a rotating sphere, the Sun shines on only half of its surface at any one time. Thus, it is simultaneously morning, evening and night time in different parts of the world (see diagram below). Because of these disparities, each country or part of a country adheres to a local time. A region of Earth's surface within which a single local time is used is called a time zone. There are 24 one hour time zones around the world, arranged roughly in longitudinal bands.

STANDARD TIME

Standard time is the official local time in a particular country or part of a country. It is defined by the time zone or zones associated with that country or region. Although time zones are arranged roughly in longitudinal bands, in many places the borders of a zone do not fall exactly on longitudinal meridians, as can be seen on the map *(above)*,

but are determined by geographical factors or by borders between countries or parts of countries. Most countries have just one time zone and one standard time, but some large countries (such as the USA, Canada and Russia) are split between several time zones, so standard time varies across those countries. For example, the coterminous United States straddles four time zones and so has four standard times, called the Eastern, Central, Mountain and Pacific standard times. China is unusual in that just one standard time is used for the whole country, even though it extends across 60° of longitude from west to east.

COORDINATED UNIVERSAL TIME (UTC)

Coordinated Universal Time (UTC) is a reference by which the local time in each time zone is set. For example, Australian Western Standard Time (the local time in Western Australia) is set 8 hours ahead of UTC (it is UTC+8) whereas Eastern Standard Time in the United States is set 5 zone is ahead or behind Coordinated Universal Time (UTC). The row of clocks indicate the time in each zone when it is 12:00 noon UTC.

hours behind UTC (it is UTC-5). UTC is a successor to, and closely approximates, Greenwich Mean Time (GMT). However, UTC is based on an atomic clock, whereas GMT is determined by the Sun's position in the sky relative to the 0° longitudinal meridian, which runs through Greenwich, UK.

In 1884 the Prime Meridian (0° longitude) was defined by the position of the cross-hairs in the eyepiece of the "Transit Circle" telescope in the Meridian Building at the Royal Observatory, Greenwich, UK.

THE INTERNATIONAL DATELINE

The International Dateline is an imaginary line from pole to pole that roughly corresponds to the 180° longitudinal meridian. It is an arbitrary marker between calendar days. The dateline is needed because of the use of local times around the world rather than a single universal time. When moving from west to east across the dateline, travelers have to set their watches back one day. Those traveling in the opposite direction, from east to west, must add a day.

DAYLIGHT SAVING TIME

Daylight saving is a summertime adjustment to the local time in a country or region, designed to cause a higher proportion of its citizens' waking hours to pass during daylight. To follow the system, timepieces are advanced by an hour on a pre-decided date in spring and reverted back in the fall. About half of the world's nations use daylight saving.

NORTH AMERICA – Political

Political Democracy is well established in some parts of the continent but is a recent phenomenon in others. The economically dominant nations of Canada and the USA have a long democratic tradition but elsewhere, notably in the countries of Central ASIA America, political turmoil has been more common. In Nicaragua and Haiti, harsh dictatorships have only recently been superseded by democratically-elected governments. North America's largest countries—Canada, Mexico, and the USA—have ARCTIC federal state systems, sharing political power between national and state or provincial governments. The USA has intervened militarily on several occasions in Central America and the Caribbean to protect its strategic interests. Beaufort Sea Bering UNITED STATES Transportation **OF AMERICA** In the 19th century, railroads were used to open up the North American continent. Air transport is now more common for long distance passenger travel, although railroads are still extensively used for bulk freight transport. Waterways, like the Mississippi River, are important for the transport of bulk materials, and the Panama Canal is Gulf of Alaska a vital link between the Pacific Ocean and the Caribbean. In the 20th century, road transportation increased massively in North America, with the introduction of cheap, mass-produced cars and extensive TERRITORIES highway construction. R COLUMBIA N Islands 0 Transportation major roads and motorways major railroads major canals international borders transport intersections WASHINGTON MONTANA international airports Salem Helena major ports WYOMING TED Standard of living ME Standard of living The USA and Canada have one of the highest Ni'ihau HAWAI'I overall standards of living in the world. UNITED STATES OF AMERICA However, many people still live in poverty, especially in inner city ghettos and some rural areas. Central America and the Caribbean are markedly poorer than their wealthier northern neighbors Haiti is the poorest country in the western hemisphere.

NORTH AMERICA – Physical

NORTH AMERICA

VANCOUVER, BRITISH COLUMBIA, CANADA
Canada's premier west coast city occupies the
delta of the Fraser river, formed among the
Coast Mountains

MOUNT SAINT HELENS, WASHINGTON, USA In 1980, this volcano's catastrophic eruption devastated 270 sq miles (700 sq km) of forest almost instantly.

GREAT SALT LAKE, UTAH, USA
A causeway carries a railroad, blocking circulation between the northern and southern parts, the water reddened by bacteria in the more saline north.

SAND HILLS, NEBRASKA, USA

Forming the largest sand sea in the Western Hemisphere
these hills are not classified as desert because today's
relatively wet climate has allowed grasses to take hold.

9 LOS ANGELES AND LONG BEACH, CALIFORNIA, USA
Taken together, these west coast cities constitute the
busiest seaport in the United States.

ISLA GUADALUPE, MEXICO
The volcanic island, 186 miles (300 km) off the west coast of Mexico, is a protected wildlife reserve.

GRAND CANYON, ARIZONA, USA The 5250 ft (1600 m) deep canyon cuts through the Kaibab Plateau in this southwest-looking view.

DENVER, COLORADO, USA

Colorado's state capital nestles under the
Rocky Mountains with the South Platte River
running through its center.

BELCHER ISLANDS, NUNAYUT, CANADA These low-lying, treeless, and sparselypopulated islands lie icebound in Hudson Bay for much of the year.

MISSISSIPPI, MISSOURI, AND ILLINOIS RIVERS, USA 6
This Infrared image shows how these rivers burst their banks in many places after heavy rains in the summer of 1993, leading to the area's worst floods on record.

RÉSERVOIR MANICOUAGAN, QUÉBEC, CANADA This unusual 62 mile (100 km) diameter annular lake occupies the low ground between the rim and central uplift of an ancient meteorite crater.

NEW YORK CITY, USA
The largest city in the United States, with
a population of over 8 million, it is also the
country's main financial center.

MISSISSIPPI RIVER DELTA, LOUISIANA, USA This delta has developed a "bird's foot'"shape due to the shifting course of the river over the last 6000 years.

FLORIDA, USA

This low-lying, subtropical peninsula is home to thousands of lakes that have formed among its limestone "karst" topography.

BARRIER REEF, BELIZE The world's second-longest barrier reef lies about 12 miles (20 km) off the coast of Belize.

SOUTH AMERICA – Political

Languages

Prior to European exploration in the 16th century, a diverse range of indigenous languages were spoken across the continent. With the arrival of Iberian settlers, Spanish became the dominant language, with Portuguese spoken in Brazil, and Native American languages, such as Quechua and Guaraní, becoming concentrated in the continental interior. Today this pattern persists, although successive

Standard of living

Wealth disparities throughout the continent create a wide gulf between affluent landowners and those afflicted by chronic poverty in inner-city slums. The illicit production of cocaine, and the hugely influential drug barons who control its distribution, contribute to the violent disorder and corruption which affect northwestern South

> shipping route, although it involves considerable wetland destruction.

SOUTH AMERICA – Physical

Climate

The climate of South America is influenced by three principal factors: the seasonal shift of high pressure air masses over the tropics, cold ocean currents along the western coast, affecting temperature and precipitation, and the mountain barrier produced by by the Andes, which creates a rain shadow over much of the south.

Average Rainfall Rainfall 0-1 in (0-25 mm) 1-2 in (25-50 mm) 2-4 in (50-100 mm) 4-8 in (100-200 mm) 20°S Tropic of Capricorn 40°S 8–12 in (200–300 mm) 12–16 in (300–400 mm) 16–20 in (400–500 mm) more than 20 in (500 January rainfall July rainfall Average Temperature **Temperature** Equato below -22°F (-30°C) -22 to -4°F (-30 to -20°C) -4 to 14°F (-20 to -10°C) 14 to 32°F (-10 to 0°C) 32 to 50°F (0 to 10°C) 20°S Tropic of 40°5 50 to 68°F (10 to 20°C)

Land use

Many foods now common worldwide originated in South America. These include the potato, tomato, squash, and cassava. Today, large herds of beef cattle roam the temperate grasslands of the Pampas, supporting an extensive meat-packing trade in Argentina, Uruguay and Paraguay. Corn (maize) is grown as a staple crop across the continent and coffee is grown as a cash crop in Brazil and

OO

Colombia. Coca plants grown in Bolivia, Peru and Colombia provide most of the western world's cocaine. Fish and shellfish are caught off the western coast, especially E A N anchovies off Peru, shrimps off Ecuador and sardines off Chile.

OCEAN

68 to 86°F (20 to 30°C) above 86°F (30°C)

Environmental Issues

The Amazon Basin is one of the last great wilderness areas left on Earth. The tropical rainforests which grow there are a valuable genetic resource, containing innumerable unique plants and animals. The forests are increasingly under threat from new and expanding settlements and "slash and burn" farming techniques, which clear land for the raising of beef cattle, causing land degradation and soil erosion.

SOUTH AMERICA

GALAPAGOS ISLANDS, ECUADOR These islands are a collection of volcanoes rising from the ocean floor 621 miles (1000 km)

SALAR DE UYUNI, BOLIVIA Occupying a depression high up on the Altiplano between the volcanoes of the western Andes and the fold belts of the eastern Andes, this is the world's largest salt flat.

MACHU PICCHU, PERU the lost Inca retreat was rediscovered in 1911 by Hiram Bingham, an American archaeologist.

Lago Viedma enjoys a milky-blue appearance due to the glacial sediment suspended in its waters.

Located on the west bank of the Paraná river, Rosario lies at that heart of Argentina's industrial corridor, centered on the river.

RONDÔNIA, BRAZIL Pale strips of forest clearance can be seen along perpendicular tracks in this region of the Amazon Basin.

MARACAIBO, VENEZUELA
Maracaibo is the center of Venezuela's oil
industry and its second largest city with a
population of 1.6 million.

AMAZON RIVER/RIO NEGRO, BRAZIL
The dark, plant debris-stained waters of
the Rio Negro join the beige Amazon near
the city of Manaus.

EMBALSE DE GURI, VENEZUELA

This enormous reservoir, on the Caroni river, was completed in 1986 and its hydroelectric plant was the first to produce more than 10 gigawatts of electricity.

FOREST CLEARANCE IN SANTA CRUZ STATE, BOLIVIA

This infrared image shows the distinctive radial
clearance patterns of original tropical dry forest
with a small settlement at each center.

LAGOA DOS PATOS AND MIRIM LAGOON, BRAZIL/URUGUAY These two lagoons are separated from the Atlantic Ocean by 248 miles (400 km) of sandbar.

ITAIPU DAM, BRAZIL/PARAGUAY 1.
With an installed capacity of 14 gigawatts this is the world
largest hydroelectric power scheme, delivering 95% of
Paraguay's energy needs and 24% of Brazil's.

Political

The political map of modern Africa only emerged following the end of World War II. Over the next half-century, all of the countries formerly controlled by European powers gained independence from their colonial rulers—only Liberia and Ethiopia were never colonized. The post-colonial era has not been an easy period for many countries, but there have been moves toward multi-party democracy across much of the continent. In South Africa, democratic elections replaced the internationally-condemned apartheid system only in 1994. Other countries have still to find political stability; corruption in government and ethnic tensions are serious problems. National infrastructures, based on the colonial transportation systems built to exploit

Scale 1:30,500,000 (projection: Lambert Azimuthal Equal Area)

Good Hope

Transportation

African railroads were built to aid the exploitation of natural resources, and most offer passage only from the interior to the coastal cities, leaving large parts of the continent untouched—five land-locked countries have no railroads at all. The Congo, Nile, and Niger river networks offer limited access to land within the continental interior, but have a number of waterfalls and cataracts which prevent navigation from the sea. Many roads were developed in the 1960s and 1970s, but economic difficulties are making the maintenance and expansion of the networks difficult.

Population

Africa has a rapidly-growing population of over 900 million people, yet over 75% of the continent remains sparsely populated. Most Africans still pursue a traditional rural lifestyle, though urbanization is increasing as people move to the cities in search of employment. The greatest population densities occur where water is more readily available, such as in the Nile Valley, the coasts of North and West Africa, along the Niger, the eastern African highlands, and in South Africa.

VICTORIA SEYCHELLES COMOROS MORONI Mayotte (to France) Mahajanga Toamasina ANTANANARIVO MAURITIUS Fianarantsoa Réunion PORT LOUIS

Languages

Three major world languages act as *lingua* francas across the African continent: Arabic in North Africa; English in southern and eastern Africa and Nigeria; and French in Central and West Africa, and in Madagascar. A huge number of African languages are spoken as well—over 2000 have been recorded, with more than 400 in Nigeria alone—reflecting the continuing importance of traditional cultures and values. In the north of the continent, the extensive use of Arabic reflects Middle Eastern influences while Bantu is widely-spoken across much of southern Africa.

Official African Languages

124

Climate

heavy marine pollution poor urban air quality

The climates of Africa range from mediterranean to arid, dry savannah and humid equatorial. In East Africa, where snow settles at the summit of volcanoes such as Kilimanjaro, climate is also modified by altitude. The winds of the Sahara export millions of tons of dust a year both northward and eastward.

Land use

Some of Africa's most productive agricultural land is found in the eastern volcanic uplands, where fertile soils support a wide range of valuable export crops including vegetables, tea, and coffee. The most widely-grown grain is corn and peanuts (groundnuts) are particularly important in West Africa. Without intensive irrigation, cultivation is not possible in desert regions and unreliable rainfall in other areas limits $% \left(1\right) =\left(1\right) \left(1\right) \left$ crop production. Pastoral herding is most commonly found in these marginal lands. Substantial local fishing industries are found along coasts and in vast lakes such as Lake Nyasa and Lake Victoria.

1 AL KHUFRAH, LIBYA

The circular irrigation patterns at this oasis have developed through the use of sprinkler units sweeping around a central point.

2 ERG DU DJOURAB, CHAD
Looking southwest, the pale area, just south of the
darker Tibesti mountains on the right and the Ennedi
plateau on the left, shows a desert sandstorm in motion

ASWAN HIGH DAM, EGYPT
Completed in 1970 the dam controls flooding
along the lower stretches of the Nile river.

KHARTOUM, SUDAN
The capital of Sudan lies at the junction of the
Blue Nile, flowing from the east, and the broad
White Nile, flowing from the south.

9 LAKE FAGUIBINE, MALI
Part of the Niger river's "inland delta," a
region of lakes, creeks and backwaters
near Tombouctou.

TASSILI-N-AJJER, ALGERIA
These sand dunes, one of a variety found in the
Sahara, overlie the darker sandstone bedrock of
the Tassili-n-Ajjer plateau.

NIGER DELTA, NIGERIA
At this point lies the vast, low-lying region
through which the waters of the Niger river
drain into the Gulf of Guinea.

CONGO/UBANGI RIVERS, DR CONGO
The confluence of these two rivers lies at the heart of the Congo Basin.

AFAR DEPRESSION, DJIBOUTI This low point is located at the junction of three tectonic plates—the Gulf of Aden to the east, the Red Sea to the north and the Great Rift Valley to the south.

NYIRAGONGO AND NYAMURAGIRA VOLCANOES, 6

DR CONGO
These two volcanoes, lying to the west of the Great Rift
Valley, last erupted in 2002 and 2001 respectively.

KILIMANJARO, TANZANIA An extinct volcano, its great height modifies the local climate, forcing moist air streams from the Indian Ocean to rise, inducing rain and, higher up, snow.

BETSIBOKA RIVER, MADAGASCAR The waters of Madagascar's second longest river are red with sediment as it carries eroded topsoil from the interior and deposits it in the Indian Ocean.

MALEBO POOL, CONGO/DR CONGO A lake in the lower reaches of the Congo river, it hosts two capital cities on its banks, Brazzaville, Congo to the north and Kinshasa, DR Congo to the south.

Seasonal flooding of the river and its tributaries turned the Mulonga and Liuwa plains on the Zambia-Angola border into a vast wetland in April 2004

BEIRA, MOZAMBIQUE This port and beach resort lies on the north side of the mouth of the Pungoé river.

CAPE TOWN, SOUTH AFRICA South Africa's third largest city with a population of 2.9 million, it is also the seat of the country's parliament.

D

E

F

Europe is the world's second smallest continent with a total area of 4,053,309 sq miles (10,498,000 sq km). It comprises 46 separate countries, including Turkey and the Russian Federation, although the greater parts of these nations lie in Asia.

EUROPE – Physical

Climate

Europe experiences few extremes in either rainfall or temperature, with the exception of the far north and south. Along the west coast, the warm currents of the North Atlantic Drift moderate temperatures. Although east–west air movement is relatively unimpeded by relief, the Alpine Uplands halt the progress of north–south air masses, protecting most of the Mediterranean from cold, north winds.

Environmental issues

The partially enclosed waters of the Baltic and Mediterranean seas have become heavily polluted, while the Barents Sea is contaminated with spent nuclear fuel from Russia's navy. Acid rain, caused by emissions from factories and power stations, is actively destroying northern forests. As a result, pressure is growing to safeguard Europe's natural environment and prevent further deterioration.

national parks Risk of acid rain

Environmental issues

Land use

Europe's swelling urban population and the outward expansion of many cities has created acute competition for land. Despite this, European resourcefulness has maximized land potential, and over half of Europe's land is still used for a wide variety of agricultural purposes. Land in northern Europe is used for cattle-rearing, pasture, and arable crops. Towards the Mediterranean, the mild climate allows the growing of grapes for wine; olives, sunflowers, tobacco and citrus fruits. ${\ensuremath{\sf EU}}$ subsidies, however, have resulted in massive overproduction and a land "set-aside" policy has

2 ORESUND LINK, DENMARK/SWEDEN
This link was opened to traffic in 2000, joining the
Danish capital, Copenhagen, with the Swedish town of
Malmö across the waters of the Oresund Strait.

BALSFJORD, NORWAY

Fjords were cut into Norway's west coast by glaciers during the last ice age but as the ice retreated rising sea-levels flooded the valleys left behind.

PRAGUE, CZECH REPUBLIC
In August 2002 some parts of the capital
were still under water after the worst
floods in living memory.

RHINE, GERMANY
The Rhine has been straightened in places, such
as here, just south of Mannheim,
to ease navigation.

HEL PENINSULA, POLAND

The long spit of this peninsula encloses Puck
Bay and shelters the important port of Gdynia.

TALLINN, ESTONIA
The capital and main port of Estonia has
become a popular tourist destination in
recent years.

LAKE VODLOZERO, RUSSIAN FEDERATION 7
The lake lies within a national park, which protects one of the most untouched wilderness areas in Europe and encompasses plains, taiga forests, and wetlands.

DANUBE DELTA, ROMANIA
The Danube river splits into several channels
as it flows into the Black Sea, forming one of
Europe's most important wetland ecosystems.

VENICE, ITALY

Occupying the largest island in a sheltered lagoon at the north end of the Adriatic, this city was founded in 452 CE and grew rich on an extensive trading network.

ISTRA PENINSULA, CROATIA This triangular peninsula marks the northern extent of Croatia's Dalmatian coastline.

MOUNT ETNA, SICILY, ITALY
This combination of visible and thermal images
shows the volcano erupting in July 2001 and
clearly indicates the major lava flows.

KEFALLONIÁ, GREECE
The largest of the Ionian Islands off Greece's
west coast, Kefalloniá is mountainous with
relatively high rainfall.

Asia is the world's largest continent with a total area of 16,838,365 sq miles (43,608,000 sq km). It comprises 49 separate countries, including 97% of Turkey and 72% of the Russian Federation. Almost 60% of the world's population lives in Asia.

FACTFILE

- N Most Northerly Point: Mys Articheskiy, Russia 81° 12′ N
- S Most Southerly Point: Pulau Pamana, Indonesia 11° S
- **E** Most Easterly Point: Mys Dezhneva, Russia 169° 40′ W
- W Most Westerly Point: Bozzcaada, Turkey 26° 2′ E

Largest Lakes:

- Caspian Sea, Asia/Europe 143,243 sq miles (371,000 sq km)
- Lake Baikal, Russian Federation 11,776 sq miles (30,500 sq km)
 Lake Balkhash, Kazakhstan/China 7115 sq miles (18,428 sq km)
- Aral Sea, Kazakhstan/Uzbekistan 6625 sq miles (17,160 sq km)
- Tonlé Sap, Cambodia 3861 sq miles (10,000 sq km)

- 1 Yangtze, China 3915 miles (6299 km)
- 2 Yellow River, China 3395 miles (5464 km)
- 3 Mekong, SE Asia 2749 miles (4425 km)
- 4 Lena, Russian Federation 2734 miles (4400 km)
- 5 Yenisey, Russian Federation 2541 miles (4090 km)

Largest Islands:

- Borneo, Brunie/Indonesia/Malaysia 292,222 sq miles (757,050 sq km)
- Sumatra, Indonesia 202,300 sq miles (524,000 sq km)
- Honshu, Japan 88,800 sq miles (230,000 sq km)
- Sulawesi, Indonesia 73,057 sq miles (189,218 sq km)
- 🗾 Java, Indonesia 53,589 sq miles (138,794 sq km)

Highest Points:

- 1 Mount Everest, China/Nepal 29,029 ft (8848 m) 2 K2, China/Pakistan 28,253 ft (8611 m)
- 3 Kangchenjunga I, India/Nepal 28,210 ft (8598 m)
- 4 Lhotse, Nepal 27,939 ft (8516 m)
- 5 Makalu, China/Nepal 27,767 ft (8463 m)

Lowest Point:

Dead Sea, Israel/Jordan -1388 ft (-423 m) below sea level

Highest recorded temperature:

Tirat Zevi, Israel 129°F (54°C)

Lowest recorded temperature:

Verkhoyansk, Russian Federation -90°F (-68°C)

Cherrapunji, India 450 in (11,430 mm)

Driest Place:

Aden, Yemen 1.8 in (46 mm)

BOSPORUS, TURKEY

The Bosporus provides the only outlet for the Black Sea, linking it with the Sea of Marmara to the south and then with the Mediterranean Sea via the Dardanelles.

MOUNT ARARAT, TURKEY Said to be the resting place for Noah's Ark, this extinct volcanic massif lies in the far east of Turkey.

LAKE BALKASH, KAZAKHSTAN Still covered in winter ice in this image, this lakes lies in a dry desert region and has no outlet.

OZERO ISSYK-KUL', KYRGYZSTAN Against the dry slopes of the Tien Shan mountains to the south this lake appears bright blue.

9 KUWAIT'S OILFIELDS, KUWAIT
The dark plumes are smoke rising from the
700 wells set alight by Iraqi forces during the
Gulf War of 1991.

10 PALM ISLAND, UNITED ARAB EMIRATES

This luxury housing development and tourist resort,
one mile (1.6 km) off the seafront of Dubai, is built from
sediments dredged from the nearby port of Jebel Ali.

The Maldives consist of 1300 coral formations in 19 atolls and stretch over 1491 miles (2400 km).

12 KARACHI, PAKISTAN
Pakistan's main seaport and former capital lies
to the northwest of the delta of the Indus river.

THREE GORGES DAM, CHINA
Seen here during its construction in 2000, the
world's largest dam is designed to tame the
Yangtze river which has regularly flooded.

BEIJING, CHINA 6

China's ancient capital was laid out on a grid pattern centred on the Forbidden City and its streets are picked out in this winter image by snowfall.

MOUNT FUJI, JAPAN
The steep, symmetrical, snow-capped volcano
last erupted in 1707.

VULKAN KLYUCHEVSKAYA SOPKA, RUSSIAN FEDERATION The Kamchatka Peninsula's highest and most active volcano last erupted in 1994.

MOUNT EVEREST, CHINA/NEPAL The world's highest mountain at 29,029 ft (8848 m) straddles the border between China and Nepal.

MOUTHS OF THE GANGES, BANGLADESH/INDIA 14
Stretching across the northern end of the Bay of Bengal,
this river delta contains the Sundarbans, the world's largest
mangrove forest, which appears as a rich green area.

MEKONG DELTA, VIETNAM
The Mekong river flows over 2494 miles (4000 km) from
the Plateau of Tibet before crossing Vietnam to reach
the South China Sea.

HONG KONG, CHINA Handed back to China by the British in 1997, this city remains east Asia's trade and finance center.

AUSTRALASIA & OCEANIA – Physical

Climate

Land use

Surrounded by water, the climate of most areas is profoundly affected by the moderating effects of the oceans. Australia, however, is the exception. Its dry continental interior remains isolated from the ocean; temperatures soar during the day, and droughts are common. The coastal regions, where most people live, are cooler and wetter. The numerous islands scattered across the Pacific are generally hot and humid, subject to the different air circulation patterns and

coffee fishing

AUSTRALASIA & OCEANIA

MELVILLE ISLAND, NORTHERN TERRITORY, AUSTRALIA
Lying off Australia's north coast, the island is sparsely
populated consisting of sandy soils and
mangrove swamps.

ANATAHAN, NORTHERN MARIANA ISLANDS The volcano on Anatahan is one of 12 in the Mariana Islands and erupted on a large scale in April 2005.

FLY RIVER, PAPUA NEW GUINEA
Flowing down from New Guinea's Central Range, the
river carries a heavy load of sediment which it deposits
in the Gulf of Papua, sometimes forming new islands.

4 RABAUL VOLCANO, NEW BRITAIN, PAPUA NEW GUINEA
After erupting in 1994, this image shows how the highest particles blew west causing condensation of water vapor over a wide area.

9 ULURU/AYERS ROCK,
NORTHERN TERRITORY, AUSTRALIA
This enormous sandstone rock occupies Australia's
heart, both physically and emotionally.

10 JAMES RANGES, NORTHERN TERRITORY, AUSTRALIA
A series of low ridges, these hills lie at the
geographical center of Australia.

11 LAKE EYRE, SOUTH AUSTRALIA, AUSTRALIA
This great salt lake consists of north and south sections, joined by a narrow channel, Lake Eyre South being the smaller, elongated saltflat at the bottom of the image.

NEWCASTLE, NEW SOUTH WALES, AUSTRALIA
The industrial seaport of Newcastle lies on the

BIKINI ATOLL, MARSHALL ISLANDS

This atoll was the site of 23 atomic bomb tests in the 1940s and 1950s, involving the intentional sinking of at least 13 naval vessels in the shallow lagoon.

GREAT BARRIER REEF, QUEENSLAND, AUSTRALIA

The world's largest reef system is made up
of 3000 individual reefs and 900 islands and
stretches for 1600 miles (2600 km).

AMBRYM, VANUATU Mount Marum, a 4166 ft (1270 m) volcano, erupted in April 2004 producing an extensive plume of ash.

KIRITIMATI, KIRIBATI Kiritimati is the largest atoll in the Pacific Ocean, its interior lagoon filled in with coral growth.

SYDNEY, NEW SOUTH WALES, AUSTRALIA Expanding outward from the inlet of Port Jackson, Australia's largest city was founded in 1788.

AORAKI/MOUNT COOK, SOUTH ISLAND, NEW ZEALAND New Zealand's highest peak rises 12,238 ft (3744 m) and is surrounded by permanent ice fields.

BANKS PENINSULA, SOUTH ISLAND, NEW ZEALAND 16
With a circular drainage pattern typical of eroded
volcanoes, this is the only recognizably volcanic
feature on New Zealand's South Island.

Countries of the World

There are currently 196 independent countries in the world – more than at any previous time – and almost 60 dependencies. Antarctica is the only land area on Earth that is not officially part of, and does not belong to, any single country. In 1950, the world comprised 82 countries. In the decades following, many more states came into being as they achieved independence from their former colonial rulers. Most recent additions were caused by the breakup of the former Soviet Union in 1991, and the former Yugoslavia in 1992, which swelled the ranks of independent states. In July 2011, South Sudan became the latest country to be formed after declaring independence from Sudan.

Geographical names

The following glossary lists geographical terms occurring on the maps and in main-entry names in the Index-Gazetteer. These terms may precede, follow or be run together with the proper element of the name; where they precede it the term is reversed for indexing purposes - thus Poluostrov Yamal is indexed as Yamal, Poluostrov.

Geographical term Language, Term

maps in this Atlas. Placenames are referenced to the largest scale map on which they appear. The policy followed throughout the Atlas is to use the local spelling or local name at regional level; commonly-used English language names may occasionally be added (in parentheses) where this is an aid to identification e.g. Firenze (Florence). English names, where they exist, have been used for all international features e.g. oceans and country names; they are also used on the continental maps and in the introductory World section; these are then fully cross-referenced to the local names found on the regional maps. The index also contains commonly-found alternative names and variant spellings, which are also fully cross-referenced.

This index lists all the placenames and features shown on the regional and continental

All main entry names are those of settlements unless otherwise indicated by the use of italicized definitions or representative symbols, which are keyed at the foot of each page.
